

Week in Review

GitHub: https://github.com/frankdavis/Davis_Frank_Portfolio.git

This week I was able to fully research and educate myself on the proper use of GIT which was making me crazy. I now completely understand and am able to use it properly with no issues. This was a major achievement because I was having trouble. I think since I use ftp's so much my mind was clouded with how they work making it difficult to understand how GIT worked. My instructor sent me some information and a new program to use that made it more like what I'm used to and it helped allot.

I again used my time management document to track my time which was helpful. It's becoming more of a habit now then an assignment which means I'm on the right track of using it properly and weekly to assist in determining how long I need to plan for assignments and tasks for the week. Also, my estimation for assignments is becoming more accurate.

Time spent reading others posts is motivational and helpful since allot of the students give examples how they have overcome their issues along the way. That gives us all new ideas and solutions we may have not thought about otherwise.

I think motivation is a strong point of mine and I hope that my postings where helpful and motivational to others. I usually add value to any project by simply staying positive and motivated to press on towards to desired goals.

Now that I understand Git more, I'll be concentrating on doing updates and commit notes to better reflect my activity. Since it appears Git is a common tool used in the web development environment I think it's great we were given this opportunity to learn it now for future use.
